To date, there is no clear analytical model of connected composite elements to demonstrate a grid continuous composite surface without any conventional fixation. To address this gap, a new design of connected patches is presented in this paper to form a grid patch surface comprising the $(m \times n)$ number of composite laminate elements that are jointed side by side.

It greatly simplifies the task of design, analysis, and manufacture of composite parts by giving engineers the tools to easily modify, update, and iterate on composite designs. This allows the engineer to work with combinations of material types, fiber orientations, stack-up orders, balance, symmetry, drop-offs, splices, and dart definitions.

Analysis of composite panels For the design of the panels, described in the previous section, the FE software ABAQUS/Standard (Abaqus) was applied. Geometrical nonlinear computations with an incremental iterative Newton–Raphson method with artificial damping (stabilize-method) up to collapse were performed. The material is linear elastic.
