CONSUMERS: Click here for the Consumer Version A solitary pulmonary nodule is defined as a discrete lesion < 3 cm in diameter that is completely surrounded by lung parenchyma (ie, does not touch the hilum, mediastinum, or pleura) and is without associated atelectasis or pleural effusion. (Evaluation of a mediastinal mass is discussed elsewhere.)

Solitary Pulmonary Nodule - Merck Manuals Professional Edition

“While up to two-thirds of benign nodules can have spiculations (lung masses that have linear strands extending into the lung but not the pleura), spiculations are seen in at least 90% of cancers,” says Alex Little, MD, a thoracic surgeon with a special interest in esophageal and lung cancer, and clinical professor at the University of Arizona.

Nodules are "spiculated"—have irregular or lobular borders. Nodules are solid. Nodules grow rapidly (on average doubling in size in four months) Nodules show no signs of calcification. Nodules are not cavitory. Presence of multiple nodules (suspicious for cancer metastases to the lungs) Nodules are located in left or right upper lobes of the lungs

What Does Having a Nodule on the Lung Mean?

A spiculated mass is a cluster of barbed tissue that is one of the primary indicators of cancer. Rather than a smooth lump, it has spicules or thin, elongated pieces of tissue sticking out from its perimeter. These spiky tumors can appear anywhere inside the body, but are often found in the breasts or lungs.

What Is a Spiculated Mass? (with pictures)

The spiculation does tend to indicate a malignancy but that doesn't mean that the news is dire. Having only one nodule and no lymph node involvement is a positive sign. When it comes to this sort of stuff everything is relative. Don't allow your fear to prevent you from being aggressive in getting the answers and treatment you need.

Does a nodule with "spiculation" mean cancer for sure?

ACR TI-RADS recommends measuring a nodule’s longest axis and the largest dimension perpendicular to the longest axis on a transverse (axial) image and the largest craniocaudal dimension on a sagittal image. These measurements usually lie parallel or perpendicular to the sound beam, but they will be angled if the nodule is obliquely oriented.

The findings states that in the left upper lobe, there is a spiculated pulmonary module that measures 9mm x 7mm. Impression: There is a solitary spiculated 9mm pulmonary nodule in the left upper lobe. The appearance would be concerning for primary bronchogenic carcinoma. Urgent referral to the thoracic triage panel is recommended.

Spiculated Masses Spiculated masses are characterized by lines of varying length and thickness radiating from the margins of the mass (Fig. 16-7). Unless it is the site of a previous biopsy, a spiculated margin is very suspicious for malignancy.

Spiculated Mass - an overview | ScienceDirect Topics

CONCLUSION:: Lung nodule sizing based on manual diameter measurement is affected by nodule margin. Interreader variability increases especially for nodules with spiculated and irregular margins, and causes substantial misclassification of nodule growth. This effect is almost neglectable for semi-automated volume measurements.
